

1a)

2-dimensional array

1b)

Input: n: positive integer

Input: m: positive integer

1. Algorithm: MemArray
2.  $S = n$  by  $m$  array
3. initialize array to -1
4. return MysteryRecursion ( $n, m$ )

Input: n: positive integer

Input: m: positive integer

1. Algorithm: MysteryRecursion
2. if  $S[n, m] = -1$
3. |        if  $n$  and  $m = 1$
4. |        |         $S[n, m] = 1$
5. |        else if  $n = 1$  then
6. |        |         $S[n, m] = m \cdot \text{MysteryRecursion}(n, \text{floor}[m/2])$
7. |        else if  $m = 1$  then
8. |        |         $S[n, m] = n \cdot \text{MysteryRecursion}(\text{floor}[n/2], m)$
9. |        else
10. |        |         $S[n, m] = n \cdot \text{MysteryRecursion}(\text{floor}[n/2], m) + m \cdot \text{MysteryRecursion}(n, \text{floor}[m/2])$
11. Return  $S[n, m]$

1c)

A nested for loop would allow iterative dynamic programming to populate the 2d-array as such:

For  $i$  from 1 to  $n$  do

```
|        For  $j$  from 1 to  $m$  do
|        |        if  $i = 1$  and  $j = 1$ 
|        |        |         $S[i, j] = 1$ 
|        |        Else if  $i = 1$ 
|        |        |         $S[1, j] = j \cdot S[1, \text{floor}[j/2]]$ 
|        |        Else if  $j = 1$ 
|        |        |         $S[i, 1] = i \cdot S[\text{floor}[i/2], 1]$ 
|        |        Else
|        |        |         $S[i, j] = i \cdot S[\text{floor}[i/2], j] + j \cdot S[i, \text{floor}[j/2]]$ 
```

2)

Vertex	Greedy	optimal
1	Red	Red
2	Blue	Blue
3	Blue	Green
4	Red	Red
5	Red	Green
6	Yellow	Blue
7	Green	Red

Since we found an example where greedy uses 4 colors, but we only need 3 colors, we have proven that the greedy algorithm is not optimal.
